Connekyt — Play Console Answers

Every answer below is derived from the shipped code. Items marked YOU require your Google accounts and cannot be answered from the repository.

Package com.amoria.connekyt.app **Version** 1.0.0 **Target API** 36 **Build** AAB (EAS production) **Backend** backend.connekyt.com

1 App Access

Answer: "All or some functionality is restricted." Add one instruction set with the credentials below.

Name	**Demo account (all features)**
Username	**play.review@amoriaglobal.com**
Password	**Connekyt#Play2026rev**

MUST HAPPEN BEFORE YOU SUBMIT

The account is seeded by `V282__seed_play_review_account.sql`. **Deploy that migration to production first** — the Android build talks to `backend.connekyt.com`. Run it on staging before production; a failed migration blocks the deploy.

Paste into "Any other info"

The account is pre-verified — no SMS code is required. Sign in with the email and password above (do not use "Continue with Google").

1. On first launch, accept the Terms, then tap through the intro (or tap to skip).
2. On the Login screen, enter the email and password above and tap Sign in.
3. **Home tab** — browse events and photographers.
4. **More → Photographers** — open any photographer for profile, packages, reviews, and to start a booking.
5. **Find My Photos** — take or upload a selfie to search event photos by face. A consent dialog is shown before the camera opens.
6. **Explore Events → any live event** — watch the stream and use live chat. Long-press any chat message to report it or block/hide the sender.
7. **Profile tab** — Blocked accounts, Privacy policy, Terms, and Delete account.

Note on purchases: buying event photos and paid live-stream access is not available in the Android app; those flows are disabled on this platform. Photographer bookings and donations remain available.

VERIFIED ABOUT THIS ACCOUNT

`otp_verified = TRUE` (no OTP screen) · `two_factor_enabled = FALSE` (no TOTP prompt) · `account_locked = FALSE` · `is_password_changed = TRUE` (no forced password change) · `customer_type = 'User'` — deliberately **not** `Viewer`, which is excluded from `ownsEvents` and would show a permanently empty Events tab.

2 Ads

Does your app contain ads? → Yes.

`StreamAdOverlay.tsx` renders first-party sponsor ads over live streams. There is no third-party ad SDK and **no Advertising ID** is collected, so this does not trigger Families Ads requirements or an ad-ID disclosure.

3 Content Rating (IARC)

Questionnaire category: **Social / Communication** — the app has user-to-user chat and user-generated content.

QUESTION	ANSWER	WHY
Violence, sexual content, profanity, controlled substances, gambling, horror	**No** to all	No first-party content of this kind
Users can interact / communicate with each other	Yes	Live stream chat, direct messages
Users can share user-generated content	Yes	Photos, live video, chat
Can users share their physical location with others?	No	No location is collected
Does the app allow purchase of digital goods?	No (on Android)	Digital purchases disabled on this platform; bookings (a real-world service) and donations remain
Unmoderated user-generated content?	No	In-app reporting and blocking ship on every UGC surface

Expected outcome: **Teen / PEGI 12**-equivalent, driven by online interaction and UGC. Answer honestly — a misrating is itself a policy violation.

4 Target Audience & Content

Target age group	**18 and over** only
Appeals to children?	**No** — branding and screenshots are not child-directed
Designed for Families	**Not applicable**

Rationale: the app has payments, KYC/identity verification, and user-generated content — none of it appropriate to target minors.

5 Data Safety

Is all user data encrypted in transit?	Yes — all traffic is HTTPS to `backend.connekyt.com`
Can users request that their data be deleted?	Yes — Profile → Delete account (`DELETE /customer/profile`). The account is anonymised and disabled; financial records are retained where legally required.

> **CORRECT THIS IF YOU USED AN EARLIER DRAFT**
> An earlier draft of `PLAY_STORE_SUBMISSION.md` stated that account deletion was missing. **It is built and shipping.** Make sure this answer says **Yes**.

> **YOU**
> Play also wants a **web deletion-request URL** reachable without installing the app. Add a page under `connekyt.com` and enter it here.

Data collected and shared

"Shared" = transferred to a third party. Cloudflare (media & streaming) and XentriPay (payments) are processors. For every row: collection is **required** (not optional), and none of it is used for advertising or marketing.

DATA TYPE	COLLECTED	SHARED	PURPOSE	NOTES
Name	Yes	No	Account management, App functionality	Signup
Email address	Yes	No	Account management, Communications	Signup
Phone number	Yes	Yes — XentriPay	Account, App functionality	Phone signup, Mobile Money
User IDs	Yes	No	Account management, App functionality	Customer id
Photos	Yes	Yes — Cloudflare	App functionality	Uploads, **face-search selfie**, **KYC ID images**
Videos	Yes	Yes — Cloudflare Stream	App functionality	Live broadcast, video messages
Voice or sound recordings	Yes	Yes — Cloudflare Stream	App functionality	Live broadcast audio
Other personal info	Yes	No	App functionality, Identity verification	KYC ID type + number
Purchase history	Yes	No	App functionality	Bookings, donations
In-app messages	Yes	No	App functionality	Live chat, direct messages
Device or other IDs	Yes	No	App functionality	Expo push token
App interactions	Yes	No	App functionality	Navigation, photo search

Declare as NOT collected

Location (precise and approximate) · Contacts · Calendar · Web browsing history · Health and fitness · SMS or call logs · Installed apps · Financial info other than purchase history · **Advertising ID** · Crash logs, diagnostics and analytics (there

is no analytics or crash-reporting SDK in `package.json`).

Sensitive call-outs

> **Face recognition.** The selfie used to find a user's photos is matched server-side. Play's Data Safety has no biometric category — declare it under **Photos**, purpose *App functionality*. It is described in the privacy policy, and an explicit consent dialog is shown before capture (`features/privacy/consent.ts`). Never claim it is used for ads.
>
> **KYC.** Government ID images (Photos) + ID number (Other personal info), purpose *Identity verification*, with consent shown before submission.

6 Store Listing

App name	Connekyt
Short description	Book photographers, buy your event photos & watch events live.
App icon	`assets/images/play-store-icon-512.png` — 512×512, 32-bit READY
Privacy Policy URL	`https://connekyt.com/user/privacy-policy` — live, HTTP 200 READY
Contact email	Confirm `info@connekyt.com` is monitored YOU
Feature graphic 1024×500	YOU
Phone screenshots (2–8)	YOU — see below

> **METADATA MISMATCH — WORTH CHANGING**
>
> The short description says "buy your event photos", which the Android reviewer **cannot do** — digital purchases are disabled on this platform. It is true of the product overall (web/iOS), but it will not match what the reviewer sees. Suggested: **"Book photographers, find your event photos & watch events live."**

Screenshots — capture these six (real UI, no invented device frames): Home dashboard · Photographers list (filters now work) · Photographer profile · Live stream with chat · Find My Photos · Profile/settings.

7 Play Service Account Key YOU

`eas.json → submit.production.android.serviceAccountKeyPath` points at `./google-play-service-account.json`, **which does not exist**, so `eas submit --profile production` fails immediately.

Either place that file at the repo root — it is now covered by `.gitignore`, **never commit it** — or skip `eas submit` and upload the `.aab` by hand in Play Console.

To create it

1. Play Console → Setup → **API access** → link or choose a Google Cloud project.
2. Google Cloud → IAM & Admin → **Service Accounts** → create one → **Keys** → Add key → **JSON** → download.
3. Back in Play Console → API access → grant that service account **Release apps to testing tracks** (and Production when you go live).
4. Save the JSON as `connekt-mobile/google-play-service-account.json`.

Alternatively, upload the key to EAS once (`eas credentials`) and drop `serviceAccountKeyPath` from `eas.json`.

8 Google Sign-In Will Fail Unless You Do This YOU

Android OAuth clients are validated against the **signing certificate SHA-1**. With Play App Signing, Google **re-signs** your app — so the certificate users actually run is **not** your EAS upload key.

> **ACTION**
>
> In **Play Console** → **Setup** → **App integrity**, copy the **App signing key certificate** SHA-1, and add it as an Android OAuth client for package `com.amoria.connekyt.app` in Google Cloud Console. Keep the EAS upload SHA-1 registered too, for internal builds.

If you skip this, "Continue with Google" fails for everyone who installs from Play — **including the reviewer**. The demo account in §1 uses email/password and is unaffected, which is why the reviewer notes say not to use Google sign-in.

Connekyt · Google Play Console submission answers · Generated from repository analysis of `connekt-mobile` and `backend`. Values not marked YOU were verified against the shipped source.
